Programming with Java Final

Fall18, CIT111, CCAC

<https://github.com/Bstanford99>

By typing in the name of 1 of the 6 moons, it displays basic facts about that moon.

I'd like to spend more time cleaning up the code, or add more facts and moons.

The screenshot shows an IDE window with a Java file named `finaljava.FinalJava`. The code is in the `main` method and contains an `if` statement: `if (enteredMoon.equals(europa.moonName)) else`. Below the code editor, the `Output` window is open, showing the following text:

```
run:
Welcome to the database of Jupiter's Moons. Please type in europa, ganymede, callisto, io, lysithea, or autonoe to display facts.
europa
